

Name	Climate Change in the Piscataqua/Great Bay Region: Past, Present, and Future
Description	This report is a detailed assessment of climate change for coastal New Hampshire that describes how the region's climate has changed over the past century, and how climate may change over the course of this century based on different global greenhouse gas emission scenarios. The impacts of our changing climate are already affecting coastal communities. This report provides decision-relevant information on a regional scale to individual, municipal, regional, and state decision-makers. The information compiled in the climate assessment provides the foundation for developing local adaptation plans to a changing climate and this project will disseminate this information to seacoast municipalities. Adaptation can help reduce the vulnerability of both natural and social systems to climate change and variability, and can assist with preparing for and coping with negative impacts. Adapting to a changing climate requires both data and information at a spatial and temporal scale that is relevant to decision making. The information compiled in this climate change assessment report, combined with the NHCAW training programs, will provide the foundation for developing local adaptation planning to a changing climate.
