<b>Name</b>	A Comparative Assessment of Heat Health Warning Systems in Boston, New York
<b>Description</b>	Many cities in the United States have introduced heat health warning systems (HHWS) in order to reduce mortality and morbidity associated with heat waves. Some evidence suggests that existing HHWS, early warning combined with actions to assist vulnerable populations, are saving lives, but the evidence is insufficient to guide the design of effective HHWS. We will conduct a comparative assessment of the major HHWS in the highly urbanized northeast. We will compare detailed evidence about the institutional structures of the three HHWS in order to understand which components are effective in saving lives and why, and what other cities can learn about how to reduce mortality and morbidity from heat waves under different climatic and socio-economic conditions. We will analyze how effectively each HHWS is serving the needs of the most vulnerable groups and what are the lessons for making HHWS responsive to the needs of the most vulnerable.
<b>Category</b>	- Climate-change Specific Projects
<b>Sector</b>	- Public Health and Safety
<b>Focus Area</b>	- Changes in Extremes of Weather and Climate
<b>Region</b>	- Regional Or State -- New England -- Mid-Atlantic
<b>Status</b>	- Ongoing
<b>Timelines</b>	Date of completion, March 2013
<b>Lead Agencies</b>	NOAA Regional Integrated Sciences and Assessments (RISA)
<b>Contacts</b>	Malgosia Madajewicz, Columbia University, mm1174@columbia.edu
